

## **Final Project: System Prototype Document**

For your Final Project in ITEC 50: Web Systems and Technologies, you are required to develop a System Prototype Document that presents the design, structure, and interaction flow of your proposed front-end web system.

This document must follow the provided template strictly. All required sections indicated in the template must be completed thoroughly, clearly, and in proper academic format.

### **General Requirements**

- The system must be based on your approved or proposed web system project.
- The document must adhere to academic writing standards (formal tone, proper grammar, organized structure), except for the reflection section (if included).
- The official template must be followed exactly in terms of section order, headings, and content requirements.
- You are required to include visual representations where applicable, such as:
  - Navigation flow diagrams
  - Interface layouts
  - Tables and structured data presentations

### **Important Notes**

- Strict compliance with the document template is mandatory. Any missing sections, incorrect structure, or deviation from the format may result in deductions or rejection of the submission.
- The focus is on design quality and usability, not on advanced programming or system deployment.
- Supplementary sections such as:
  - Front Page
  - Acknowledgments
  - Abstract

may be included at your discretion, provided that the main body strictly follows the required template.

### **Required Paper Format**

All submissions must strictly follow the formatting specifications below:

- Font Style: Arial
- Font Size: 11 pt
- Line Spacing: 1.15
- Margins: Normal (1 inch on all sides)
- Paper Size: A4

Failure to follow these formatting requirements will result in corresponding deductions.

### **Submission Expectation**

Your final output should be a well-organized, professionally written System Prototype Document that effectively presents your web system's:

- Design structure
- Interface behavior
- User interaction flow

This document should reflect both your technical understanding of front-end development and your ability to apply user-centered design principles in a structured academic format.

### **Required Sections**

#### **1. Rationale (Background of the System)**

- Explain the purpose of your system.
- Provide context on why the system is needed.
- Discuss the problem it aims to solve and its relevance to the subject/course.

#### **2. Review of Existing Related Systems**

- Describe current systems that are similar to your project.
- Highlight their strengths and limitations.
- Provide comparisons that justify the need for your proposed system.

#### **3. System Requirements**

- **Functional Requirements:** List the specific features and functions your system must perform.
- **Non-Functional Requirements:** Include performance, usability, reliability,

scalability, and other quality attributes.

#### **4. Comparison and Improvements**

- Explain how your system improves upon or differs from existing systems. ▪

Highlight innovations, efficiency gains, or unique contributions.

- Discuss the expected benefits for users or society.

#### **5. Reflection Section (Per Group Member)**

- Each member must write a personal reflection.
- Include what they learned, challenges faced, contributions made, and how the project enhanced their understanding of the subject.
